Portuguese (Native), English (Advanced) and Spanish (Intermediary)

EDUCATION

Universidade Federal de Minas Gerais

Engineer's degree, Systems Engineering
2015 - 2021

Centro Federal de Educação Tecnológica de Minas Gerais

Technical course, Computer Systems Networking and Telecommunications
2013 - 2015

EXPERIENCE

Senior Software Engineer · Xprt (client: Payzen) · Jan 2024 – Present

- Joined a 9-engineer team at Payzen, a US healthcare fintech making medical bills affordable through personalized “care now, pay later” payment plans.
 - Built full-stack features across Payzen’s server-side rendered (SSR) onboarding funnel, covering bill intake, customer onboarding and payment plan selection, on a platform onboarding thousands of new payment plans every day.
 - Developed the customer self-service platform in React and TanStack, where enrolled patients manage their plans: making extra payments, pausing or freezing a plan, and adding new bills.
 - Built Node.js/TypeScript microservices with Fastify and PostgreSQL, deployed on Kubernetes on AWS, within a large ecosystem of intercommunicating services, including occasional work on care-provider integrations.
 - Worked hands-on with observability every day, using Grafana, Sentry, Elasticsearch/Kibana and LogRocket to keep bills and payments traceable across the microservices ecosystem.
 - Stack: TypeScript, Node.js, Fastify, React, TanStack, PostgreSQL, Kubernetes, AWS, Microservices
-

Full Stack Engineer · Plank (client: Jolly) · Feb 2023 – Jan 2024

PLANK

- Engineer responsible for Jolly, an early-stage platform that rewards caregivers and frontline workers with points redeemable for gift cards to improve retention, built almost from scratch with a team of four engineers.
 - Integrated care-provider systems to pull care logs, through their APIs where available and Puppeteer-based scraping where not.
 - Built the points engine that rewards good practices such as on-time clock-ins, completed missions and well-written care logs.
 - Built the missions system, where workers set up and accept missions, and the redemption flow for gift cards.
 - Built the backend as serverless Node.js/TypeScript AWS Lambda functions.
 - Stack: TypeScript, Node.js, React, AWS Lambda, Serverless, Puppeteer
-

Senior Software Engineer, Backend · Hotmart · Jun 2019 – Jan 2023

- Led the transition of ROBOS.im's chat and bot platform into Hotmart after the acquisition, then owned the product end to end.
 - Designed and built a multi-channel communication system — Email, SMS, WhatsApp and Chat — handling millions of messages per day.
 - Built and owned every channel integration, together with the queues and notification topic processing behind them.
 - Owned the data storage for the messages and state the system handled.
 - Built it as a large event-driven architecture on AWS with SNS, SQS and Lambda, plus Node.js microservices owning each channel's scope.
 - Carried over the conversation system I built at ROBOS.im to power real-time chat across the whole platform.
 - Stack: Node.js, TypeScript, AWS (SNS, SQS, Lambda), Serverless, Microservices, WebSockets, NLU, DevOps
-

Lead Backend Developer · ROBOS.im · Mar 2018 – Oct 2018

- Lead backend developer on a no-code platform for building AI-driven chatbots, used by businesses to automate customer engagement.
 - Integrated external NLU services (wit.ai and IBM Watson) so bots could detect user intent with a confidence score and answer the most common questions automatically.
 - Built the conversation system behind the platform's chat channel, with real-time messaging over websockets — later carried into Hotmart after the acquisition.
 - Built the backend as Node.js microservices over PostgreSQL and MongoDB.
 - Stack: JavaScript, Node.js, PostgreSQL, MongoDB, Microservices, WebSockets, NLU
-

Full Stack Engineer · Teknisa Software · Apr 2015 – Feb 2018

- Built a real-time order service and Kitchen Display System (KDS) for food service companies, splitting each order across kitchen sectors and scheduling when each item's preparation starts so all dishes for a table are ready at the same time.
- Built new components for the internal framework all company products were built on, so product teams could ship features faster and more reliably.
- Joined as an intern on the product team and later moved to the internal framework development team.
- Stack: JavaScript, AngularJS, Node.js, SQL

SKILLS

- | | |
|-----------------|------------------------------|
| • JavaScript | • AWS |
| • TypeScript | • Google Cloud (GCP) |
| • Node.js | • Kubernetes |
| • React | • Docker |
| • Microservices | • SQL & NoSQL databases |
| • Serverless | • DevOps |
| • WebSockets | • Python |
| • LLMs | • Event Driven Architectures |

HONORS & AWARDS

Hackathon 1st Place - DCC UFMG

Aug 2016

First place in a university-wide Hackathon with a document-sharing app designed to streamline collaboration among students within the same class, bringing the campus community together through technology.
